An ultrasonic generator with a power up to 10 kilowatts with magnetostrictive vibrators, operating with a frequency of 20-22 kilocycles, is required for the cleaning of jets under industrial conditions. A generator with this power is able to carry out a simultaneous cleaning of several scores of jets. The cleaning of jets takes 4-6 min. instead of hours, as in the case with the chemical method applied at present. The ultrasonic treatment does not corrode the spinning jets and does not affect the dimensions or the shape of the orifices.

Order from LC or SLA mi$1.80, ph$1.80 61-10286

Trans. of Moscow U. Vest[nik]. [Seriya Matematiki, Mekhaniki, Astronomii, Fiziki, Khimii] (USSR) 1956 [v. 11] no. 2, p. 71-76.

The viscosity of 8 tin-bismuth alloys and of pure tin was examined with a rotation-type viscosimeter. The viscosity of molten metals containing insoluble admixtures showed hysteresis. Molten metals that were purified of such admixtures by filtration in vacuum did not exhibit any viscosity hysteresis. The insoluble admixtures retard the process of recoordination of the atoms (and, consequently, the change of viscosity) during which the atoms pass from the low-temperature packing to the high-temperature packing.

Tests indicated that pressure is raised above atmospheric pressure the strength of the concrete hardening in it is greatly increased. To shorten the time of the hydrothermal treatment and still obtain crack-free blocks, the surface modulus of the object made of ash foam-concrete must be not less than 12 m^{-1}; this is ensured by providing holes in the block or reducing the thickness of the pieces. During the heating-up period (t_c < 100) the holes have virtually no ac-
